Let  $G$  be a simply connected simple algebraic group over an algebraically closed field  $\mathbb{k}$  and let  $B$  be a Borel subgroup of  $G$ . Let  $\mathfrak{X} = G/B$ ,  $\mathcal{D}_{\mathfrak{X}}$  the sheaf of  $\mathbb{k}$ -algebras of differential operators on  $\mathfrak{X}$ ,  $\mathcal{D}_{\mathfrak{X}}\mathbf{qc}$  the category of left  $\mathcal{D}_{\mathfrak{X}}$ -modules that are quasi-coherent over the structure sheaf  $\mathcal{O}_{\mathfrak{X}}$  of  $\mathfrak{X}$ ,  $\mathcal{D}(\mathfrak{X}) = \Gamma(\mathfrak{X}, \mathcal{D}_{\mathfrak{X}})$  the  $\mathbb{k}$ -algebra of differential operators on  $\mathfrak{X}$ , and  $\mathcal{D}(\mathfrak{X})\mathbf{Mod}$  the category of left  $\mathcal{D}(\mathfrak{X})$ -modules. We say  $\mathfrak{X}$  is  $D$ -affine iff for each  $\mathcal{M} \in \mathcal{D}_{\mathfrak{X}}\mathbf{qc}$  (i) the natural morphism  $\mathcal{D}_{\mathfrak{X}} \otimes_{\mathcal{D}(\mathfrak{X})} \Gamma(\mathfrak{X}, \mathcal{M}) \rightarrow \mathcal{M}$  is epic, and (ii)  $H^i(\mathfrak{X}, \mathcal{M}) = 0 \ \forall i > 0$ ; equivalently, the functor  $\Gamma(\mathfrak{X}, ?) : \mathcal{D}_{\mathfrak{X}}\mathbf{qc} \rightarrow \mathcal{D}(\mathfrak{X})\mathbf{Mod}$  gives an equivalence of categories with quasi-inverse  $\mathcal{D}_{\mathfrak{X}} \otimes_{\mathcal{D}(\mathfrak{X})} ?$  (cf. [K98a, 1.6]).

In characteristic 0 a celebrated theorem of Beilinson and Bernstein [BB] affirms that  $\mathfrak{X}$  is  $D$ -affine. In positive characteristic B. Haastert [H87, 4.4.1] shows that in (i) even the natural morphism

$$(1) \quad \mathcal{O}_{\mathfrak{X}} \otimes_{\mathbb{k}} \Gamma(\mathfrak{X}, \mathcal{M}) \rightarrow \mathcal{M} \text{ is epic.}$$

Then by Grothendieck's vanishing theorem (ii) will hold if  $H^i(\mathfrak{X}, \mathcal{D}_{\mathfrak{X}}) = 0 \ \forall i > 0$ . If  $(\text{Diff}_m)_{m \in \mathbb{N}}$  is the standard filtration of  $\mathcal{D}_{\mathfrak{X}}$ , however, [H87, 4.2.7] shows that if  $p = \text{ch } \mathbb{k} > h$  the Coxeter number of  $G$  and if  $G$  is not of type  $A_1$ , then

$$(2) \quad H^i(\mathfrak{X}, \text{Diff}_p) \neq 0 \text{ for some } i \neq 0.$$

And yet there is another filtration, called the  $p$ -filtration, on  $\mathcal{D}_{\mathfrak{X}}$ . If  $\mathcal{O}_{\mathfrak{X}}^{(r)}$  is the sheaf of  $\mathbb{k}$ -algebras such that  $\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}}^{(r)}) = \{a^{p^r} | a \in \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}})\}$  for each open  $\mathfrak{U}$  of  $\mathfrak{X}$  and if  $\mathcal{D}_r = \text{Mod}_{\mathcal{O}_{\mathfrak{X}}^{(r)}}(\mathcal{O}_{\mathfrak{X}}, \mathcal{O}_{\mathfrak{X}})$ , then  $\mathcal{D}_{\mathfrak{X}} = \bigcup_{r \in \mathbb{N}} \mathcal{D}_r$ . As  $\mathfrak{X}$  is noetherian,

$$(3) \quad H(\mathfrak{X}, \mathcal{D}_{\mathfrak{X}}) \simeq \varinjlim_r H(\mathfrak{X}, \mathcal{D}_r).$$

Let  $G_r = \ker F^r$  with  $F^r : G \rightarrow G^{(r)}$  the  $r$ -th Frobenius morphism [J, I.9],  $\hat{Z}_r$  the induction functor from the category  $B\mathbf{Mod}$  of  $B$ -modules to the category  $G_r B\mathbf{Mod}$  of  $G_r B$ -modules [J, I.3], and let  $\mathcal{L}$  be the functor from  $B\mathbf{Mod}$  to the category of  $G$ -equivariant  $\mathcal{O}_{\mathfrak{X}}$ -modules [J, I.5]. Then by [H87, 4.3.3]

$$(4) \quad \mathcal{D}_r \simeq \mathcal{L}(\hat{Z}_r(\mathbb{k})^*) \simeq \mathcal{L}(\hat{Z}_r(2(p^r - 1)\rho)),$$

where  $\rho = \frac{1}{2} \sum_{\alpha \in R^+} \alpha$  with  $R^+$  the positive system of roots of  $G$  such that the roots of  $B$  are  $-R^+$ . If  $G = SL_2$  or  $SL_3$ , then the composition factors of  $\hat{Z}_r(2(p^r - 1)\rho)$  in  $G_r B\text{Mod}$  have all dominant highest weights [H87, 4.5.4], hence  $H^i(\mathfrak{X}, \mathcal{D}_r) = 0 \ \forall i > 0$  by Kempf's vanishing theorem, showing  $\mathfrak{X}$  is  $D$ -affine in those cases. The argument unfortunately does not generalize.

There is another criterion for  $\mathfrak{X}$  to be  $D$ -affine [Ka, Th. 1.4.1]:  $\mathfrak{X}$  is  $D$ -affine iff there is a dominant weight  $\lambda$  such that for all  $r \gg 0$  the natural morphism

$$(1) \quad \mathcal{D}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{L}(-r\lambda) \otimes_{\mathfrak{k}} H^0(r\lambda) \rightarrow \mathcal{D}_{\mathfrak{X}}$$

splits as a morphism of sheaves of abelian groups, where  $H^0(?) = H^0(\mathfrak{X}, \mathcal{L}(?)) = \Gamma(\mathfrak{X}, \mathcal{L}(?))$ . If  $\text{Dist}(G)$  (resp.  $\text{Dist}(B)$ ) is the algebra of distributions on  $G$  (resp.  $B$ ), the natural morphism (5) can be described by the commutative diagram

$$(2) \quad \begin{array}{ccc} \mathcal{D}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{L}(-r\lambda) \otimes_{\mathfrak{k}} H^0(r\lambda) & \xrightarrow{\hspace{10em}} & \mathcal{D}_{\mathfrak{X}} \\ \sim \downarrow & & \downarrow \sim \\ \mathcal{L}(\text{Dist}(G) \otimes_{\text{Dist}(B)} (-r\lambda) \otimes_{\mathfrak{k}} H^0(r\lambda)) & \xrightarrow{\mathcal{L}(\text{Dist}(G) \otimes_{\text{Dist}(B)} (-r\lambda) \otimes_{\mathfrak{k}} \text{ev}_{r\lambda})} & \mathcal{L}(\text{Dist}(G)), \end{array}$$

where  $\text{ev}_{r\lambda} : H^0(r\lambda) \rightarrow r\lambda$  is the evaluation at the identity element of  $G$ . In characteristic 0 the map  $\text{Dist}(G) \otimes_{\text{Dist}(B)} (-r\lambda) \otimes_{\mathfrak{k}} \text{ev}_{r\lambda}$  has been proved to split in  $B\text{Mod}$  so that  $\mathcal{L}(\text{Dist}(G) \otimes_{\text{Dist}(B)} (-r\lambda) \otimes_{\mathfrak{k}} \text{ev}_{r\lambda})$  splits as a morphism of  $G$ -equivariant  $\mathcal{O}_{\mathfrak{X}}$ -modules to show the  $D$ -affinity of  $\mathfrak{X}$  [BB].

Assume in the following that  $\text{ch } \mathfrak{k} = p > 0$ . If  $\mathfrak{X}$  is  $D$ -affine, in view of  $1 \in \mathcal{D}(\mathfrak{X})$  we must have for a given  $r$  the morphism

$$(3) \quad \mathcal{D}_s \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{L}(-r\lambda) \otimes_{\mathfrak{k}} H^0(r\lambda) \rightarrow \mathcal{D}_s$$

splits as a morphism of sheaves of abelian groups for  $s \gg 0$ . By (4) the morphism (7) reads as

$$\mathcal{L}(\widehat{\text{ev} \otimes_{\mathfrak{k}} \text{ev}}) : \mathcal{L}(\hat{Z}_s(2(p^s - 1)\rho - r\lambda) \otimes_{\mathfrak{k}} H^0(r\lambda)) \rightarrow \mathcal{L}(\hat{Z}_s(2(p^s - 1)\rho)),$$

where  $\widehat{\text{ev} \otimes_{\mathfrak{k}} \text{ev}} \in G_s B\text{Mod}(\hat{Z}_s(2(p^s - 1)\rho - r\lambda) \otimes_{\mathfrak{k}} H^0(r\lambda), \hat{Z}_s(2(p^s - 1)\rho))$  is induced by the Frobenius reciprocity from  $\text{ev} \otimes_{\mathfrak{k}} \text{ev} \in B\text{Mod}(\hat{Z}_s(2(p^s - 1)\rho - r\lambda) \otimes_{\mathfrak{k}} H^0(r\lambda), 2(p^s - 1)\rho)$  the tensor product of evaluations  $\text{ev}_{2(p^s - 1)\rho - r\lambda} : \hat{Z}_s(2(p^s - 1)\rho - r\lambda) \rightarrow 2(p^s - 1)\rho - r\lambda$  and  $\text{ev}_{r\lambda} : H^0(r\lambda) \rightarrow r\lambda$ .

Now  $1 \in \mathcal{D}_s$  belongs to  $\mathcal{O}_{\mathfrak{X}}$  and  $\mathcal{O}_{\mathfrak{X}}$  is a direct summand of  $\mathcal{D}_s$  as an  $\mathcal{O}_{\mathfrak{X}}$ -module, in fact, as a  $G$ -equivariant  $\mathcal{O}_{\mathfrak{X}}$ -module, corresponding to the splitting of the quotient  $\pi : \hat{Z}_s(2(p^s - 1)\rho) \rightarrow \text{hd}_{G_s B} \hat{Z}_s(2(p^s - 1)\rho) = \mathfrak{k}$  in  $B\text{Mod}$ . Then we should have at least the composite

$$\begin{array}{ccc} H^0(\hat{Z}_s(2(p^s - 1)\rho - r\lambda) \otimes H^0(r\lambda)) & \dashrightarrow & \mathfrak{k} \\ & \searrow \text{H}^0(\widehat{\text{ev} \otimes_{\mathfrak{k}} \text{ev}}) & \uparrow \text{H}^0(\pi) \\ & & H^0(\hat{Z}_s(2(p^s - 1)\rho)) \end{array}$$

to be surjective, that we will verify in what follows.

We will suppress  $\mathfrak{k}$  in  $\otimes_{\mathfrak{k}}$ . By the tensor identity we have a commutative diagram

$$\begin{array}{ccc} \hat{Z}_s(2(p^s - 1)\rho - r\lambda) \otimes_{\mathfrak{k}} H^0(r\lambda) & \xrightarrow{\widehat{\text{ev} \otimes \text{ev}}} & \hat{Z}_s(2(p^s - 1)\rho) \\ \sim \downarrow & \nearrow \hat{Z}_s((2(p^s - 1)\rho - r\lambda) \otimes \text{ev}) & \\ \hat{Z}_s((2(p^s - 1)\rho - r\lambda) \otimes H^0(r\lambda)) & & \end{array}$$

As  $\text{ev} : H^0(r\lambda) \rightarrow r\lambda$  is surjective and as  $\hat{Z}_s$  is exact,  $\widehat{\text{ev} \otimes \text{ev}}$  is surjective, hence  $\pi \circ \widehat{\text{ev} \otimes \text{ev}}$  is surjective. On the other hand,

$$\begin{aligned} G_s B\text{Mod}(\hat{Z}_s(2(p^s - 1)\rho - r\lambda) \otimes H^0(r\lambda), \mathfrak{k}) &\simeq G_s B\text{Mod}(\hat{Z}_s(r\lambda)^* \otimes H^0(r\lambda), \mathfrak{k}) \\ &\simeq G_s B\text{Mod}(H^0(r\lambda), \hat{Z}_s(r\lambda)) \\ &\simeq B\text{Mod}(H^0(r\lambda), r\lambda) \quad \text{by the Frobenius reciprocity} \\ &\simeq \mathfrak{k}. \end{aligned}$$

If  $\text{Tr} : \text{Mod}_{\mathfrak{k}}(\hat{Z}_s(r\lambda), \hat{Z}_s(r\lambda)) \rightarrow \mathfrak{k}$  is the trace map, the composite

$$\begin{array}{ccc} \hat{Z}_s(\lambda)^* \otimes H^0(r\lambda) & \dashrightarrow & \mathfrak{k} \\ \hat{Z}_s(\lambda)^* \otimes \text{res}_{r\lambda} \downarrow & & \uparrow \text{Tr} \\ \hat{Z}_s(r\lambda)^* \otimes \hat{Z}_s(r\lambda) & \xrightarrow{\sim} & \text{Mod}_{\mathfrak{k}}(\hat{Z}_s(r\lambda), \hat{Z}_s(r\lambda)) \end{array}$$

also belongs to  $G_s B\text{Mod}(\hat{Z}_s(r\lambda)^* \otimes H^0(r\lambda), \mathfrak{k})$ , where  $\text{res}_{r\lambda}$  is the restriction from  $G$  to  $G_s B$ . Take  $s$  so large that  $\langle r\lambda, \alpha^\vee \rangle < p^s$  for all simple root  $\alpha$ . Then  $\text{res}_{r\lambda} : H^0(r\lambda) \rightarrow \hat{Z}_s(r\lambda)$  is injective, hence  $\text{Tr} \circ (\hat{Z}_s(r\lambda)^* \otimes \text{res}_{r\lambda}) \neq 0$ . It follows that

$$\pi \circ \widehat{\text{ev} \otimes \text{ev}} = \text{Tr} \circ (\hat{Z}_s(r\lambda)^* \otimes \text{res}_{r\lambda}) \quad \text{up to } \mathfrak{k}^\times.$$

**Proposition.** Assume  $p \geq 2(h-1)$ . If  $0 \leq \langle \nu + \rho, \alpha^\vee \rangle < p^s$  for each simple root  $\alpha$ , then  $H^0(\pi \circ \widehat{\text{ev} \otimes \text{ev}}) : H^0(\hat{Z}_s(2(p^s - 1)\rho - \nu) \otimes H^0(\nu)) \rightarrow \mathfrak{k}$  is surjective.

*Proof.* By the argument above it is enough to show  $H^0(\text{Tr} \circ (\hat{Z}_s(\nu)^* \otimes \text{res}_\nu)) : H^0(\hat{Z}_s(\nu)^* \otimes H^0(\nu)) \rightarrow \mathfrak{k}$  is surjective. By the hypothesis on  $\nu$  we have from [J, II.11.13]

$$(4) \quad \text{hd}_G H^0(2(p^s - 1)\rho) \simeq \mathfrak{k} \simeq \text{hd}_{G_s} H^0(2(p^s - 1)\rho)$$

and that the restriction

$$\text{res}_{2(p^s - 1)\rho - \nu} : H^0(2(p^s - 1)\rho - \nu) \rightarrow \hat{Z}_s(2(p^s - 1)\rho - \nu) \text{ is surjective.}$$

On the other hand,  $\text{res}_\nu : H^0(\nu) \rightarrow \hat{Z}_s(\nu)$  is injective. As  $G_s B\text{Mod}(\hat{Z}_s(\nu)^* \otimes H^0(\nu), \mathfrak{k}) \simeq \mathfrak{k}$ , there is a commutative diagram up to  $\mathfrak{k}^\times$

$$\begin{array}{ccccc} H^0(\nu)^* \otimes H^0(\nu) & \xleftarrow{\text{res}_\nu^* \otimes H^0(\nu)} & \hat{Z}_s(\nu)^* \otimes H^0(\nu) & \xrightarrow{\hat{Z}_s(\nu)^* \otimes \text{res}_\nu} & \hat{Z}_s(\nu)^* \otimes \hat{Z}_s(\nu) \\ & \searrow \text{Tr} & & \swarrow \text{Tr} & \\ & & \mathfrak{k} & & \end{array}$$

Hence we have only to show that  $H^0(\text{Tr} \circ (\text{res}_\nu^* \otimes H^0(\nu)))$  is surjective.

As  $G_s B\text{Mod}(Z_s(\nu)^* \otimes H^0(\nu), \mathfrak{k}) \simeq \mathfrak{k}$  again, we have a commutative diagram in  $G_s B\text{Mod}$

$$(5) \quad \begin{array}{ccc} H^0(\nu)^* \otimes H^0(\nu) & \xrightarrow{\text{Tr}} & \mathfrak{k} \\ \uparrow \text{res}^* \otimes H^0(\nu) & & \downarrow \sim \\ \hat{Z}_s(\nu)^* \otimes H^0(\nu) & & \text{hd}_{G_s B} \hat{Z}_s(2(p^s - 1)\rho) \\ \sim \downarrow & & \uparrow \pi \\ \hat{Z}_s(2(p^s - 1)\rho - \nu) \otimes H^0(\nu) & \xrightarrow{\widehat{\text{ev}} \otimes \widehat{\text{ev}}} & \hat{Z}_s(2(p^s - 1)\rho) \\ \uparrow \text{res}_{2(p^s - 1)\rho - \nu} \otimes H^0(\nu) & & \uparrow \text{res}_{2(p^s - 1)\rho} \\ H^0(2(p^s - 1)\rho - \nu) \otimes H^0(\nu) & \longrightarrow & H^0(2(p^s - 1)\rho), \end{array}$$

where the bottom horizontal map is the cup product surjective by Mathieu's theorem [M] (cf. also [K98b]). Moreover, if  $\pi_G : H^0(2(p^s - 1)\rho) \rightarrow \text{hd}_G H^0(2(p^s - 1)\rho)$  is the quotient morphism, we have from (8) a commutative diagram

$$\begin{array}{ccc} H^0(2(p^s - 1)\rho) & \xrightarrow{\pi \circ \text{res}_{2(p^s - 1)\rho}} & \text{hd}_{G_s B} \hat{Z}_s(2(p^s - 1)\rho) \\ & \searrow \pi_G & \downarrow \sim \\ & & \text{hd}_G H^0(2(p^s - 1)\rho). \end{array}$$

Hence taking  $H^0(?)$  of (9) yields a commutative diagram

$$\begin{array}{ccc} H^0(\hat{Z}_s(\nu)^* \otimes H^0(\nu)) & \xrightarrow{H^0(\text{Tr}(\text{res}_\nu^* \otimes H^0(\nu)))} & \mathfrak{k} \\ \uparrow H^0(\text{res}_\nu^* \otimes H^0(\nu)) & & \uparrow \pi_G \\ H^0(2(p^s - 1)\rho - \nu) \otimes H^0(\nu) & \longrightarrow & H^0(2(p^s - 1)\rho) \end{array}$$

It follows that  $H^0(\text{Tr} \circ (\text{res}_\nu^* \otimes H^0(\nu))) \neq 0$ , as desired.
